Principles of Cash Flow Valuation Apr 20 2022 Principles of Cash Flow Valuation is the only book available that focuses exclusively on cash flow valuation. This text provides a comprehensive and practical, market-based framework for the valuation of finite cash flows derived from a set of integrated financial statements, namely, the income statement, balance sheet, and cash budget. The authors have distilled the essence of years of gathering academic wisdom in the study of cash flow analysis and the cost of capital. Their work should go a long way toward bridging the gap between the application of cost benefit analysis and the theory of capital budgeting. This book covers the basic concepts in market-based cash flow valuation. Topics include the time value of money (TVM) and an introduction to cost of capital; basic review of financial statements and accounting concepts; construction of integrated pro-forma financial statements; derivation of free cash flows; use of the WACC in theory and in practice; estimating the WACC for non traded firms; calculating the terminal value beyond the planning period. It also revisits the theory for cost of capital and explains how cash flows are valued in reality. The ideas are illustrated using examples and a case study. The presentation is appropriate for a range of technical backgrounds. This text will be of interest to finance professionals as well as MBA and other graduate students in finance. * Provides the only exclusive treatment of cash flow valuation * Authors use examples and a case study to illustrate ideas * Presentation appropriate for a range of technical backgrounds: ideas are presented clearly, full exposition is also provided * Named among the Top 10 financial engineering titles by Financial Engineering News

Determining Machine and Capital Equipment Charge-Out Rates Using Discounted Cash-Flow Analysis Feb 06 2021 The model ChargeOut! was developed to determine charge-out rates or rates of return for machines and capital equipment. This paper introduces a costing methodology and applies it to a piece of capital equipment. Although designed for the forest industry, the methodology is readily transferable to other sectors. Based on discounted cash-flow analysis, ChargeOut! provides more accurate financial outputs than traditional single-period models. ChargeOut! produces a break-even charge-out rate that will return any specified after-tax real rate of return over the economic life of the capital equipment. Alternatively, given a negotiated charge-out rate, the model produces net present values and real and nominal rates of return before tax and financing, before tax, and after tax. It also compares the negotiated charge-out rate with the calculated break-even rate, incorporates inflation, accounts for depreciation, and automatically conducts a sensitivity analysis. Graphs illustrate the major cost centers and cash flows.

Principles of Cash Flow Valuation Jul 11 2021 The valuation of assets, both tangible and intangible, is an important element of corporate finance. Putting a price tag on ideas is almost impossible, and in the new economy, where companies grow dependent on intangible assets all the time, market volatility can be attributed in large part to our collective ignorance of their value. There are two basic approaches to valuation: from financial statements to cash flows, and from cash flows to financial statements. The former projects historical financial statements into the future and the latter attempts to construct cash flow statements and use them in forecasting future financial statements. Established companies use the first method and start-ups the second. In Principles of Cash Flow Valuation, the authors strive to "close the gap" between these two approaches by presenting the principles of cash flow valuation and cost of capital in a clear and systematic fashion. * Provides the only exclusive treatment of cash flow valuation * Authors use examples and a case study to illustrate ideas * Presentation appropriate for a range of technical backgrounds: ideas are presented clearly, full exposition is also provided * Named among the Top 10 financial engineering titles by Financial Engineering News

Discounted Cash Flow Sep 20 2019 Firm valuation is currently a very exciting topic. It is interesting for those economists engaged in either practice or theory, particularly for those in finance. The literature on firm valuation recommends logical, quantitative methods, which deal with establishing today's value of future free cash flows. In this respect firm valuation is identical with the calculation of the discounted cash flow, DCF. There are, however, different coexistent versions, which seem to compete against each other. Entity approach and equity approach are thus differentiated. Acronyms are often used, such as APV (adjusted present value) or WACC (weighted average cost of capital), whereby these two concepts are classified under entity approach. Why are there several procedures and not just one? Do they all lead to the same result? If not, where do the economic differences lie? If so, for what purpose are different methods needed? And further: do the known procedures suffice? Or are there situations where none of the concepts developed up to now delivers the correct value of the firm? If so, how is the appropriate valuation formula to be found? These questions are not just interesting for theoreticians; even the practitioner who is confronted with the task of marketing his or her results has to deal with it. The authors systematically clarify the way in which these different variations of the DCF concept are related throughout the book *ENDORSEMENTS FOR LÖFFLER: DISCOUNTED* 0-470-87044-3 "Compared with the huge number of books on pragmatic approaches to discounted cash flow valuation, there are remarkably few that lay out the theoretical underpinnings of this technique. Kruschwitz and Löffler bring together the theory in this area in a consistent and rigorous way that should be useful for all serious students of the topic." --Ian Cooper, London Business School "This treatise on the market valuation of corporate cash flows offers the first reconciliation of conventional cost-of-capital valuation models from the corporate finance literature with state-pricing (or 'risk-neutral' pricing) models subsequently developed on the basis of multi-period no-arbitrage theories. Using an entertaining style, Kruschwitz and Löffler develop a precise and theoretically consistent definition of 'cost of capital', and provoke readers to drop vague or contradictory alternatives." --Darrell Duffie, Stanford University "Handling firm and personal income taxes properly in valuation involves complex considerations. This book offers a new, precise, clear and concise theoretical path that is pleasant to read. Now it is the practitioners task to translate this approach into real-world applications!" --Wolfgang Wagner, PricewaterhouseCoopers "It is an interesting book, which has some new results and it fills a gap in the literature between the usual undergraduate material and the very abstract PhD material in such books as that of Duffie (Dynamic Asset Pricing Theory). The style is very engaging, which is rare in books pitched at this level." --Martin Lally, University of Wellington

The Acquisition of Anadarko by Chevron. Discounted Cash Flow Analysis Oct 02 2020 Bachelor Thesis from the year 2020 in the subject Business economics - Investment and Finance, grade: 1.3, University of Mannheim (Chair of Corporate Finance), language: English, abstract: In this thesis, I am going to value Anadarko using the Discounted Cash Flow (DCF) method and applying reasonable assumptions for post-merger synergy effects with Chevron. As validation for my forecast assumptions, which are based on predictions and trends from early 2019, I will include a summary of the overall Oil & Gas industry as well as Anadarko's and Chevron's positioning alongside the different stages of the value chain. To estimate my cost of capital I will apply the WACC method instead of APV, using the cost of equity and cost of debt as input factors, together with a terminal growth rate instead of an approach with exit multiples. In order to determine how sensitive my results are concerning key input variables like the Weighted Average Cost of Capital (WACC) or the terminal growth rate I will also run a sensitivity analysis. Lastly, I will talk about the synergy estimates used in my calculations and bring them into context with my DCF calculations in order to determine if the transaction would create value for shareholders on both sides of the deal. Although my calculations ultimately lead me to the result that the price originally offered by Chevron was fair, both in regards to Anadarko's share price prior to the deal announcement as well as the intrinsic value determined by my DCF, the deal would not have benefited shareholders on both sides equally. While Anadarko's shareholders would have gotten an immediate double-digit price increase, Chevron shareholders would have lost value with the acquisition, despite my calculations including significant synergies of roughly \$1bn per year. The goal of my thesis, however, is not only to describe the assumptions, calculations and results of my DCF analysis, but to also bring them into a wider context. On 12th April 2019 Chevron Corporation announced that they have agreed to acquire all outstanding shares of Anadarko Petroleum Corporation for a total consideration of \$65 per share. This marked the first major transaction announcement for quite a while in the Oil & Gas (O&G) industry, which previously saw stock prices near their 10-year lows. Despite a good initial reaction from Anadarko's shareholders, Chevron ended up missing out on the deal, with Occidental Petroleum Corporation, a close peer of Anadarko, buying the company for \$76.67 per share.
