This manual is intended to guide and facilitate human anatomical dissections. It is flexible enough for use in long as well as short courses. It can be particularly useful as a link with real anatomy when used together with computerised-anatomy programs, or where students do not dissect but merely look at atlases, prosections and models. There is an introduction for each anatomical region; and for each section to be dissected there is an overview, a dissection schedule which guides the student through a set of instructions, a summary and a list of objectives that are clinically important. The terminology used is the latest. The manual is suitable for medical and dental students. It is also of value for advanced knowledge of anatomy for surgery and in relation to the interpretation of normal anatomy in non-invasive imaging of anatomy for clinical diagnosis, surgical practice on cadaveric material, and in discussions about clinical problems. The Bohensky Dissection Series has been used successfully by more than 300,000 biology students nationwide. Each book in the series is designed to guide the student through the study of anatomical structures. The books do this through the use of clearly marked photographs and illustrations. Accompanying text offers the student both easy-to-follow dissection instructions and factual information about the section under observation. At the end of each chapter there are tests which can be used for self-study or for grade course evaluation. Within the traditional dissection portion of a biology course, many programs include the sheep heart, eye, and brain. Within many of these guides, the author has incorporated photographs of these structures to more closely follow standard course curriculum. The author also provides important information on human organs such as the eye, ear, and heart. In this way, the student can better understand the role and function of these organs as they relate to human life processes. Add to this each book's large-size format, lay-flat spiral binding, and reasonable cost, and you can see why the Bohensky Dissection Series has become one of the most successful dissection guides used throughout this country's schools. This manual represents an experiment both as to choice of animal and plan of work. The dog has been chosen as subject of dissection instead of a large herbivore for several reasons. The student-specimen ratio can be reduced with a resultant increase in time for dissection by the individual student. At the same time more material can be covered in a given period than by using the horse or ox owing to the smaller size of the specimen and the ease with which structures are cleaned and visualized. These and other advantages result not only in better preparation of a student to study the more economically important animals, but also increases the time that can be devoted to the study of those regions most often involved surgically. The dog is cheaply purchased, preserved and prepared for dissection. After the arteries are filled with red latex they stand out more vividly than in life. The large systemic veins can also be injected. A large part of a dissected dog can be seen in a single field of vision. Structures can be left in place, e.g., the heart is dissected without removing it from the thorax. Terms used in veterinary anatomy are largely taken from human anatomy. Since in the dog structures closely resemble those of man, an advantage in making homologies to the mutual benefit of teacher and student results. In general all terms have been Anglicized except most names of muscles, and even these Latin names have been used as if they were English in some places. The Latin terms were retained to differentiate muscles from nerves and vessels; furthermore most veterinarians prefer to use them. The improved BNA or INA terminology has been used almost entirely. Needless to say the excellent texts of Ellenberger and Baum, and Sisson and Grossman have been used frequently as references. It is probable that both have influenced the terminology more than they should, since a uniform terminology is desired by all anatomists. This three volume set is a complete guide to anatomy and dissection for undergraduate medical students. This book was written to serve both as a guide for the dissection of the human brain and as an illustrated compendium of the functional anatomy of the brain and spinal cord. In this sense, the book represents an updated and expanded version of the book The Human Brain and Spinal Cord written by the author and published in Swedish by Scandinavian University Books in 1961. The complicated anatomy of the brain can often be more easily appreciated and understood in relation to its development. Some insight about the coverings of the brain will also make the brain dissections more meaningful. Introductory chapters on these subjects constitute Part I of the book. Part 2 is composed of the dissection guide, in which text and illustrations are juxtaposed as much as possible in order to facilitate the use of the book in the dissection room. The method of dissection is similar to dissection procedures used in many medical schools throughout the world, and variations of the technique have been published by several authors including Ivar Broman in the "Manniskohjarnan" (The Human Brain) published by Gleerups Förlag, Lund, 1926, and Laszlo Komaromy in "Dissection of the Brain," published by Akademiai Kiado, Budapest, 1947. The great popularity of the CT scanner justifies an extra laboratory session for the comparison of nearly horizontal brain sections with matching CT scans. This lab manual carefully guides students through dissections and is richly illustrated. First and foremost, the basic animal architecture is presented in a clear and concise manner. Throughout the dissections, the authors pause strategically to bring the students' attention to the significance of the material they have just covered. This manual combines the features of a traditional anatomy laboratory manual with those of a dissection manual and an anatomical atlas. Superb photos and illustrations are supplemented with observation instructions for a wide variety of specimens including cats, cadavers, isolated organs, histology slides and models. Exercises include review questions, labeling, coloring, and drawing. A 132 color plate folio of labeled cadaver specimen and anatomical model photos is a distinguishing feature of this laboratory guide. This full-color dissection manual is intended to provide an introduction to the anatomy of the mink for biology, zoology, nursing, or preprofessional students who are taking a laboratory course in anatomy and physiology or basic vertebrate anatomy. Features: Multiple images of the muscle, skeletal, and organ systems provide a complete picture of the layers of mink anatomy. Detailed instructions allow students to efficiently and accurately perform all of the dissections. Superior quality, completely labeled, full-color photographs and illustrations offer excellent visual references. The text is clearly written, and dissection instructions are set apart in boxes to aid the students in the lab. Informative tables summarize key information, and student objectives establish the purpose of each chapter and lab. The dissection guide is loose-leaf and three-hole drilled for convenience in the laboratory. Because prepared mink skeletons are not always available, the cat skeleton is utilized in the skeletal system chapter along with pictures of mink structures, as appropriate. The second edition of this indispensable guide provides a step-by-step approach to learning the anatomy and principal procedures of temporal bone dissection starting with mastoidectomy and including approaches to the internal auditory canal and jugular foramen. The renowned authors share their collective wisdom and pearls gleaned from years of treating patients with temporal bone disease and teaching these methodologies to medical students, residents, and fellows. Procedural details are presented throughout 10 detailed chapters, accompanied by beautiful sequential illustrations and videos. One of the most complex regions of the human body, the temporal bone and adjacent skull base present unique surgical challenges. Critical neurovascular structures traverse complex pathways through the temporal bone, which itself has highly variable anatomy. Tumors and erosive lesions create additional anatomical barriers that make effective access and resection of diseased areas difficult. At the same time, the surgical skills required to navigate this anatomy are indispensable to the management of ear disease and associated disability, and provide alternative approaches with less morbidity to intracranial pathology. This book presents technical and strategic considerations for safe and effective temporal bone surgery. Key Highlights: Videos of cadaveric and surgical dissections highlight critical technical steps and appropriate execution More than 160 meticulous, expertly illustrated pen and ink drawings of progressive dissections A new chapter on middle ear endoscopy details key anatomical features and technical maneuvers integral to this approach New chapters on infratemporal surgical dissection and the intraoperative management of complications are also presented Expanded coverage of the middle fossa approach to the internal auditory canal and methods of assessing competencies when training novice surgeons in temporal bone dissection This is a must-have tool that will enable residents and novice surgeons to translate laboratory skills to the operating room and perform safe, efficacious and efficient dissection of the temporal bone. It is the quintessential learning guide for residents in otolaryngology-head and neck surgery and skull base surgery, as well as an excellent teaching and assessment tool for faculty. Excerpt from The Anatomy of the Horse: A Dissection Guide The want of an illustrated topographical treatise on equine anatomy has, in the experience of the author, been a great barrier to the efficient teaching of that all-important branch of veterinary education. In this work the object of the author has been to place in the hands of veterinary students a dissection guide comparable, in some degree, to the text-books at the service of the practical student of human anatomy. The order of dissection laid down is that which the author has found to be most advantageous, and he has attempted to describe with accuracy and moderate fulness the different organs as they present themselves in that order. This description is largely supplemented by the illustrations, which are so complete that almost every organ in the body is delineated. The majority of these illustrations are original, being faithful portraits of the author's own dissections. It is hoped that they will prove useful to the student, in the first place, as a plan and a guide in his work, and, secondly, as a means by which he may afterwards summon up a mental picture of his own dissections. While the book is specially designed for use in the dissecting-room, the author ventures to hope that it may also be serviceable to the veterinary practitioner. Special care has been taken in portraying those regions that possess a surgical interest, and the illustrations furnish a ready means by which the surgeon may refresh his memory regarding the objects to be met in the course of an operation. The greater number of the original drawings were made in the dissecting-room of the Royal (Dick's) Veterinary College, by Mr J. Bayne, artist; a few were executed by Mr R. S. Reid, artist; and the remainder by Mr R. H. Potts, veterinary student. A few of the illustrations were directly drawn on stone by Messrs W. & A. K. Johnston. To all of these gentlemen the author is much indebted for the clearness and fidelity with which they have delineated the

various objects. The source of each of the borrowed illustrations is duly acknowledged elsewhere, but the author is constrained to make special mention of those from the systematic text-book of Professor Chauveau, who generously consented to the copying of as many of his figures as might be thought useful for this work.
